

Question 5

Solve the equation

$$\cos(x) = 0.29$$

for all $x \in [0, 2\pi]$, and round your answers to two decimal places.

Question 5 - Solution

Step 1: Isolate the trigonometric function. The equation becomes

$$\cos(1x) = 0.29, \quad u = 1x, \quad 0 \leq u \leq 2\pi.$$

Let $\alpha = \arccos(0.29)$. All solutions are

$$u = \pm\alpha + 2k\pi, \quad k \in \mathbb{Z}.$$

Step 2: Restrict and convert. Keep precisely the values of u in $[0, 2\pi]$ and divide by 1. Evaluating the inverse function at full precision and rounding only the final values gives

$$x \approx 1.28, 5.01.$$

These are all 2 solutions in the stated interval, in radians. Substitution of the unrounded values verifies the original equation.
