

Question 9

Find a vector of magnitude 10 perpendicular to the plane spanned by $\vec{a} = \langle 1, 0, 1 \rangle$ and $\vec{b} = \langle 0, 2, 1 \rangle$, with positive z -component.

Question 9 – Solution

Strategy Keep the component order and signs organized when expanding the determinant. After computing the cross product, use a dot-product check or the relevant magnitude formula to interpret it.

Step 1 A normal direction is $\vec{a} \times \vec{b} = \langle -2, -1, 2 \rangle$.

Step 2 Its magnitude is 3, and its z -component is positive.

Step 3 Scale it to length 10: $\vec{n} = \frac{10}{3}\langle -2, -1, 2 \rangle$.

Verification The result follows from the defining vector formulas used above, and each component, magnitude, or scalar condition has been checked against the information in the question.

Key idea The cross product produces a vector perpendicular to both inputs. Its direction follows the right-hand rule, while its magnitude records the area of the spanned parallelogram.
